1. **Statistical probability distribution-preserving accumulation of log transformed data**

Patent number: 6778910

Type: Grant

Filed: February 26, 2003

Date of Patent: August 17, 2004

Assignee: Coulter International Corp.

Inventors: Patricio Vidal, John S. Riley, Malek Adjouadi

Abstract: A signal processing operator successfully expands the dynamic range of a histogram of digital data, such as that representative of biological cell populations, including human blood cells subjected to flow cytometry processing, without introducing binning artifacts into the transformed data. The inventive data mapping scheme effectively preserves statistical probability distribution characteristics of the original data, that would otherwise be removed or lost in the course of expanding the dynamic range of a quantized histogram data set through the use of a conventional log transformation. Filtering is unnecessary, as the

binning effect is countered early in the process, to preserve statistical properties of the cell populations under study.

2. Artificial neural network design and evaluation tool

Patent number: 7502763

Type: Grant

Filed: August 12, 2005

Date of Patent: March 10, 2009

Assignee: The Florida International University Board of Trustees

Inventors: Melvin Ayala, Malek Adjouadi

Abstract: Disclosed herein is a programming tool stored on a computer-readable medium and adapted for implementation by a computer for designing an artificial neural network. The programming tool includes a network configuration module to provide a first display interface to support configuration of the artificial neural network, and a pattern data module to provide a second display interface to support establishment and modification of first and second pattern data sets for training and testing the artificial neural network, respectively.

3. Electrocardiography triggered transcranial magnetic stimulation systems and methods of using the same

Patent number: 10137308

Type: Grant

Filed: March 17, 2014

Date of Patent: November 27, 2018

Assignee: The Florida International University Board of Trustees

Inventors: Malek Adjouadi, Mercedes Cabrerizo, Niovi Rojas, Juan Omar Perez, Jesus de la Rua, Anastasio A. Cabrera

Abstract: Embodiments of the subject invention provide hardware-software assimilated systems that align, in time and space, electrocardiography (ECG) with the neuro-navigated Transcranial Magnetic Stimulation (TMS) (e.g., a TMS machine), as well as methods of manufacturing such systems and methods of performing ECG and TMS using such systems. A system of the present invention can be integrated and non-invasive and can include a hardware component that can automatically activate pedals of the TMS machine to, for example, perform different operational functions, including increasing intensity of the magnetic pulse, decreasing intensity of the magnetic pulse, providing a magnetic pulse with a predefined intensity, and aborting the stimulation if any undue effect on the cardiac rhythm is detected. The system can also include a software component, stored on one or more computer-readable media (e.g., non-transitory media), that can serve a dual purpose of: reading an ECG signal and synchronizing the trigger of the TMS machine via the hardware component, a synchronization which can be made in relation to any of the deflections of the recorded ECG (e.g., in order to maintain a normal heartbeat during stimulation); and serving as a graphical user interface (GUI) for a user of the system.

4. Hardware/software integrated design for a 3D tremor detector using TMS in Parkinson's disease and related disorders

Patent number: 10188869

Type: Grant

Filed: July 20, 2015

Date of Patent: January 29, 2019

Assignee: The Florida International University Board of Trustees

Inventors: Mercedes Cabrerizo, Malek Adjouadi, Niovi Rojas, Juan Omar Perez, Anastasio A. Cabrera, Jesus De La Rua

Abstract: The subject invention provides hardware-software assimilated systems to evaluate the efficacy of the repetitive Transcranial Magnetic Stimulation (rTMS) on patients with Parkinson's Disease (PD) and related disorders before, during, and/or after the stimulation-based treatment. Embodiments of the subject invention provide integrated Tremor Sensor TMS systems that can control magnetic stimulation of the brain according to selected moments in the tremor cycle, as well as methods of manufacturing such systems and methods for performing tremor detection and TMS using such systems. If the magnetic stimulus from a TMS is not adequately adjusted to the patient-specific tremor frequency, there is the potential that the expected outcome may not be completely achieved, but the same stimulus can reduce or suppress the tremor if the magnetic stimulation is adequately adjusted. Systems of the subject invention can ensure the latter result.

5. Low intensity magnetic field device for cosmetic skin treatment – A company called Bellalura was created based on this device.

Patent number: 10195456

Type: Grant

Filed: March 3, 2016

Date of Patent: February 5, 2019

Assignee: The Florida International University Board of Trustees

Inventors: Mercedes Cabrerizo, Malek Adjouadi, Niovi Rojas, Juan Perez

Abstract: The subject invention provides novel and advantageous devices and methods for cosmetic skin treatment using a magnetic field, as well as methods of fabricating and using such devices. A device can include one or more coils (e.g., micro-coils) for generating a magnetic field, such as a low intensity magnetic field. The device can be a hand-held and/or portable device and can include a stimulation head having the one or more coils. The device can be used to apply a magnetic field to a patient (e.g., a human patient) for cosmetic skin treatment. In an embodiment, a handheld device for skin treatment can include a case, a stimulation head coupled with the case and comprising at least one coil of conductive wire for generating a magnetic field, and an electronic circuit, housed in the case, for driving the at least one coil to generate the magnetic field. The electronic circuit can be configured to drive the at least one coil to generate a main pulse of the magnetic field at a main frequency, and the main pulse can include a plurality of sub-pulses at a sub-frequency that is greater than the main frequency.

RESEARCH COLLABORATIONS ESTABLISHED

The following are strong, longstanding and ongoing research collaborations that have been established. All IRB protocols and memorandum of understandings have been approved.

1. Mount Sinai Medical Center, Wien Center for Alzheimer's Disease and Memory Disorders.

Our long-standing collaboration with the Wien Center for Alzheimer's Disease and Memory Disorders at the Mount Sinai Medical Center (MSMC) continues to thrive through major joint publications and proposals. Our work is of broad scope but with a clear mission of integrating neuroimaging (PET and MRI scans), cognitive tests, and standardized uptake value ratio (SUVR) as means to quantify the Amyloid Beta (ABETA) burden, all to define the disease state and severity. We are currently collaborating on developing new machine learning algorithms and visualization mechanisms that help with diagnosis and prognosis in both cross-sectional and longitudinal studies.

2. Baptist Hospital

In our collaboration with Baptist Hospital, we continue to help perform 3D source localization of epileptic seizures in adults. We currently focused on repetitive transcranial magnetic stimulation (rTMS) for brain stimulation on patients with epilepsy. IRB protocols have been approved for this research work with the intent to reduce the frequency of occurrence of seizures in patients with recurrent epileptic seizures. We have also started a new collaboration with the new leadership at the Miami Neuroscience Institute to work on mental health including depression and Obsessive compulsive disorder (OCD).

3. University of Florida, The 1Florida Alzheimer's Disease Research Center

Our collaboration with the University of Florida is through our partnership with the 1Florida Alzheimer's Disease Research Center (1Florida-ADRC), a premier research center on Alzheimer's disease. Together with Mount Sinai Medical Center, a strong partner to the 1Florida ADRC, the CATE center has been involved in developing a web interface for data entry, data processing and data mining shared across all institutions that are part of this major

research center. We are currently looking into new machine learning algorithms for prediction and classification of AD. We are so fortunate this past year to have received a \$15M NIH grant that was awarded to our consortium of academic and medical institutions that include (UF as lead, Mount Sinai Medical Center, FIU, UM, and FAU) as the National Institutes of Health's National Institute on Aging: NIH P30 AWD00000010303 --The 1Florida Alzheimer's Disease Research Center.

4. University of Miami, Center for Cognitive Neuroscience and Aging

Our collaboration focuses on integrating new Neuropsychological testing with neuroimaging (PET, MRI, Tau and DTI) for the detection of the earliest stage of Alzheimer's disease (AD). We are attempting to identify the most effective biomarkers to study the progression of Alzheimer's disease in conjunction with the cognitive test scores. This work is conducted with the help of the Wien Center for Alzheimer's Disease and Memory Disorders at Mount Sinai Medical Center (MSMC) and the 1Florida Alzheimer's Disease Research Center (ADRC) led by the University of Florida (UF) in partnership with MSMC.

5. Nicklaus Children's Hospital, Brain Institute

Our collaboration with Nicklaus Children's Hospital continues to involve the development of more precise algorithms for 3D source localization of seizure onsets. The focus is now placed on brain connectivity networks using electroencephalography (EEG), magnetic resonance imaging (MRI) and functional MRI, all in context of the computed 3D source. This is an added approach to the EEG-triggered fMRI approach for validating the 3D source. Three of our Ph.D. students are currently serving as research interns with the Brain Institute at NCH.

6. Oregon Health Sciences University, Portland Oregon

OHSU and FIU continue to collaborate on strengthening our understanding of signals generated by the nervous system in response to sensory stimuli, as a critical step for intra-operative monitoring during spine surgery that place parts of the somatosensory pathways at risk. Our work enhances the clinical application and the process of diagnosis in intra-operative neurophysiological monitoring (IONM). In the last two years we have focused on new 3D source localization methods using high-definition EEG and MRI and stereo EEG (SEEG). We are also looking at different physiological signals while recording EEG signals in an effort to predict onset of seizures in epileptic patients.

7. Children's National Medical Center, Washington D.C.

Our collaboration with Children's National Medical Center (CNMC) in Washington D.C. continues to focus on consolidating multicenter collaborative studies for enabling the systematic examination of large numbers of patients in pediatric epilepsy. The efforts extend to integrating electroencephalography (EEG) with functional MRI (fMRI) and brain connectivity studies. This collaboration also includes brain connectivity studies to assess the effects of the 3D source of an epilepsy on the connection links and strength between the different electrodes in relation to their positioning with respect to the 3D source.

8. Computing Alliance of Hispanic Serving Institutions (CAHSI)

The Computing Alliance of Hispanic Serving Institutions (CAHSI) is formed by founding members like UTEP, FIU, UPRM, NMSU, UHD, Texas A&M Corpus Christy, and California State University, Dominguez Hills. Since then several other institutions have joined the Alliance. This Alliance seeks educational initiatives and strategies to enhance recruitment and advancement of Hispanics through graduate school and onto the professorate. Dr. Adjouadi is a founding Member of the Alliance and continues to help with funded grants like the NSF-Broadening Participation in Computing (BPC) program and the NSF- Inclusion across the Nation of Communities of Learners of Underrepresented Discoverers in Engineering and Science (INCLUDES).

9. Herbert Wertheim College of Medicine, Department of Psychiatry & Behavioral Health

In collaboration with the Department of Psychiatry & Behavioral Health (Dr. Patricia Junquera), we are helping subjects with depression with a protocol that involves the use of repetitive transcranial magnetic stimulation (rTMS). Electroencephalography (EEG) recordings and neuropsychological testing are taken at baseline, during the protocol and the end of the protocol to gauge the benefits of using rTMS on patients with depression.
